SUMMARY

Software engineer shipping distributed systems, developer platforms, and production AI agent systems. Currently at MIFX (Indonesia's largest futures broker) architecting Rina, an internal AI platform used across code review, documentation, and solution architecture over a dozen services. Three years of production engineering across Go, TypeScript, and PHP, starting before my CS degree. Came up through Generasi GIGIH (GoTo's independent study program), converted intern to full-time at Rey.id, now pursuing CS at Binus University in parallel.

EXPERIENCE

MIFX (Monex Investindo Futures) — Software Engineer

Feb 2025 – Present

Indonesia's leading online trading broker, est. 2000. One of the country's largest licensed futures brokerages.

- Architected and deployed Rina, an internal AI agent system automating handles code review, solution architecture, and documentation across 12 microservices—reducing PR review turnaround by ~40% and compressing documentation drafting from days to minutes.
- Built a **Go** CLI and **Nix**-based developer platform that cut new engineer environment setup from 2+ hours to under 15 minutes (~87% reduction) across 12 containerized Laravel services.
- Engineered a **Go**-based release automation platform integrating **GitLab CI** and **Jira** with AI-generated pre-deployment plans (from MR diff analysis via Rina), Open-source core published as glsync.

IHC (Pertamina Bina Medika) — Software Engineer

May 2024 – Nov 2024

Indonesia's largest state-owned hospital network (Pertamina subsidiary), operating 50+ hospitals nationwide.

- Developed and maintained hospital information systems in **Laravel** serving 4 Pertamina hospitals and supporting hundreds of healthcare staff.
- Designed a secure file management layer using **SFTPGO** and **Docker**, replacing manual transfers and eliminating a class of data-handling compliance risks.
- Standardized development across 5 services with a shared framework and CI-enforced test gates by implementing unit tests.

Rey.id — Software Engineer

Aug 2022 – Feb 2024

Series Seed insurtech startup (\$8.7M raised). Winner of Startup World Cup 2023 regional title.

- Designed, developed and maintained a B2B system from scratch using **NodeJS**, **ExpressJS**, **Typescript**, **PostgreSQL**, **Redis**, **Kafka**, **SonarQube**, and **New Relic**. Powered B2B product line generating 3B IDR ARR.
- Spearheaded a real-time client dashboard using **Apollo GraphQL**, giving 20+ companies self-serve visibility into employee data and relevant business insights.
- Architected a bulk onboarding pipeline ingesting 4,000+ member records per batch, cutting client go-live timelines from weeks to days.

Rey.id — Backend Engineer Intern

May 2022 – Aug 2022

Selected as 1 of 30 interns from 150+ applicants via Generasi GIGIH (GoTo).

- Migrated a legacy JavaScript service to TypeScript—5 event subscribers, 50 endpoints, 9,000+ LOC—while increasing unit test coverage from 83% to 99% (16% increase).

PROJECTS

Open-source core of MIFX's release automation platform.

- **Go** webhook service that drives Jira tickets through workflow states from GitLab push and MR events. Uses PostgreSQL as a durable job queue with exponential-backoff retries and a stuck-job reconciler — no external message broker. The production version at MIFX extends this with Rina, adding MR-diff-driven pre-deployment plan generation.

IdentifAI — [Github](#)

2025

AI-powered HR interview platform.

- Built a full-stack AI interview platform: **Go** backend with LLM orchestration for adaptive questioning, competency extraction, BARS scoring, and resume parsing; **NextJS** frontend; **Python** simulation harness for end-to-end testing of LLM-driven flows. Integrates **OpenRouter** via a pluggable LLM provider abstraction.

Digitalize — [Github](#)

2024

Exam question management platform for Kemendikbud (Indonesian Ministry of Education).

- Shipped a full-stack exam question management platform for Kemendikbud, replacing manual spreadsheet workflows with a multi-stage authoring pipeline, hierarchical tree data structures for educational taxonomies, dynamic Excel import/export, and **FrankenPHP** containerization behind government infrastructure with **Laravel**, **Livewire**, **PostgreSQL**.

EDUCATION

Binus University — B.S. Computer Science (Night school, online)

2023 – 2027 (Expected)

GPA: 3.84 / 4.00 | Google Developer Student Club (GDSC)

TECHNICAL SKILLS

Languages: Go, TypeScript, JavaScript, PHP, Ruby, Python, SQL

Infrastructure: Docker, Kubernetes, GCP, Nix, GitLab CI/CD, GitHub Actions, Grafana, Loki, Tempo, Mimir, New Relic

Data & Messaging: PostgreSQL, Redis, Kafka, Google Pub/Sub, GraphQL

Practices: Microservices, Event-Driven Architecture, Clean Architecture, TDD, CI/CD, Feature Flagging, Dead Letter Queue

AI/LLM: AI Agent (OpenClaw), OpenRouter, LLM orchestration pipelines, context engineering
